Run a basic Word Count Map Reduce program to understand Map Reduce Paradigm

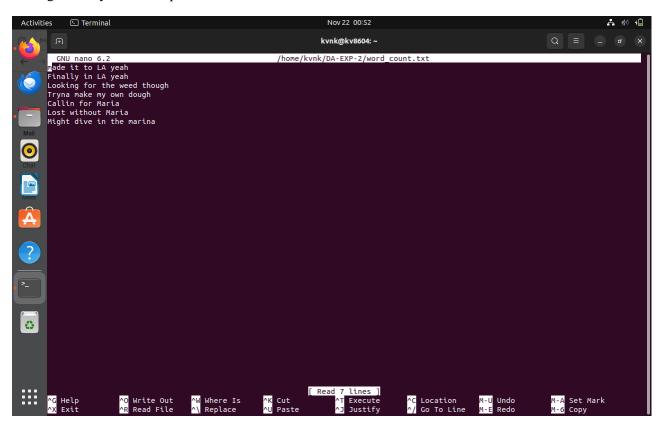

Aim:

To Run a basic Word Count MapReduce program to understand Map Reduce Paradigm.

Procedure:

Step 1: Create Data File:

Create a file named "word_count_data.txt" and populate it with text data that you wish to analyze. Login with your Hadoop user.

Step 2: Mapper Logic - mapper.py:

Create a file named "mapper.py" to implement the logic for the mapper. The mapper will read input data from STDIN, split lines into words, and output each word with its count.

nano mapper.py

Copy and paste the mapper.py code

#!/usr/bin/env python3

import sys because we need to read and write data to STDIN and STDOUT

#!/usr/bin/python3
import sys
for line in sys.stdin:
 line = line.strip()
 # remove leading and trailing whitespace
 words = line.split()
 # split the line into words for word in words:

```
nano word count.txt print( '%s\t%s' % (word, 1))
```

Step 3: Reducer Logic - reducer.py:

Create a file named "reducer.py" to implement the logic for the reducer. The reducer will aggregate the occurrences of each word and generate the final output.

```
nano reducer.py
# Copy and paste the reducer.py code
reducer.py
#!/usr/bin/python3
from operator import itemgetter
import sys
current word = None
current count = 0
word = None
for line in sys.stdin:
        line = line.strip()
        word, count = line.split('\t', 1)
        try:
                count = int(count)
        except ValueError:
                continue
        if current word == word:
                current count += count
        else:
                if current word:
                        print( '%s\t%s' % (current word, current count))
                current count = count
                current word = word
if current word == word:
```

Step 4: Prepare Hadoop Environment:

Start the Hadoop daemons and create a directory in HDFS to store your data.

print('%s\t%s' % (current_word, current_count))

```
start-all.sh
```

```
hdfsdfs -mkdir/word count in python
```

hdfsdfs -copyFromLocal /path/to/word count.txt/word count in python

Step 5: Make Python Files Executable:

Give executable permissions to your mapper.py and reducer.py files.

chmod 777 mapper.py reducer.py

Step 6: Run Word Count using Hadoop Streaming:

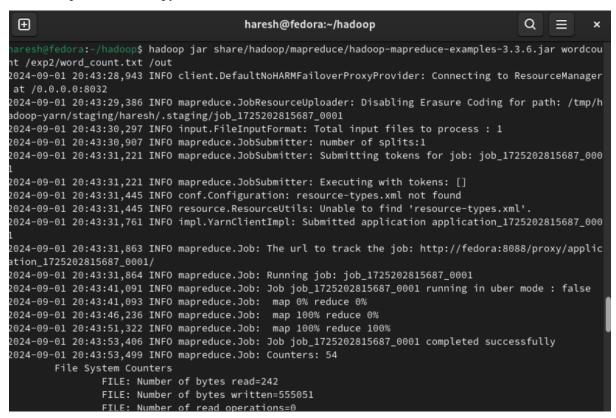

Download the latest hadoop-streaming jar file and place it in a location you can easily

access.

Then run the Word Count program using Hadoop Streaming.

hadoop jar /path/to/hadoop-streaming-3.3.6.jar \

- -input /word count in python/word count data.txt \
- -output /word count in python/new output \
- -mapper /path/to/mapper.py \
- -reducer /path/to/reducer.py

Step 8: Check Output:

Check the output of the Word Count program in the specified HDFS output directory.

hdfs dfs -cat/word count in python/new output/part-00000

```
kvnk@kv8604:~$ hdfs dfs -cat /word_count_in_python/new_output/part-00000

Result:

Thus, the program for basic Word Count Map Reduce has been executed successfully.
